20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

Thsi flood control project consists of three structures: the Main Dam, the Diversion Dike and Dike No. 2. Each structure is an earth embankment at 3H:1V with a good grass cover and a top width of 12 feet. Based on the visual inspection, review of design information and past operational performance, these structures are judged to be in GOOD condition. These structures are classified as INTERMEDIATE in size and HIGH hazard potential structures. The test flood is the PMF.

NEDED

Honorable William A. O'Neill
Governor of the State of Connecticut
State Capitol
Hartford, Connecticut 06115

Dear Governor O'Neill:

Inclosed is a copy of the Talcott Reservoir Dam, Main Dam (CT-00490), Diversion Dike (CT-00489) and Dike No. 2 (CT-01710) Phase I Inspection Report, prepared under the National Program for Inspection of Non-Federal Dams. This report is based upon a visual inspection, a review of the past performance and a brief hydrological study of the dam. I approve the report and support the findings and recommendations described in Section 7 and ask that you keep me informed of the actions taken to implement them. This follow-up action is vitally important.

Copies of this report have been forwarded to the Department of Environmental Protection. Copies will be available to the public in thirty days.

I wish to thank you and the Department of Environmental Protection for your cooperation in this program.

Sincerely,

C. E. EDGAR, III
Colonel, Corps of Engineers
Commander and Division Engineer

NATIONAL DAM INSPECTION PROGRAM

PHASE I - INSPECTION REPORT

Identification No.:	CT 00489 (Diversion Dike) CT 00490 (Main Dam) CT 01710 (Dike No. 2)
Name of Dam:	Talcott Reservoir Dam
Town:	West Hartford
County and State:	Hartford County, Connecticut
Stream:	Tributary to Trout Brook
Date of Inspection:	November 17, 1980

BRIEF ASSESSMENT

This flood control project consists of three (3) structures: the Main Dam, the Diversion Dike and Dike No. 2. Each structure is an earth embankment at 3H:1V with a good grass cover and a top width of 12 feet.

Principal dimensions of these three structures are as follows:

Structure	**Length (ft.)**	**Height(ft.)**
Main Dam	1300	30
Diversion Dike	3125	30
Dike No. 2	210	18.5

The Diversion Dike is located 3000 feet north of the Main Dam; while Dike No. 2 lies 600 feet east of the Diversion Dike.

The principal spillways consist of a reinforced concrete riser and 30 inch RCP through the Main Dam and Diversion Dike. The emergency spillways are grassed channels, 40 feet wide in the eastern 1/3 of the Main Dam and 90 feet wide at the eastern end of the Diversion Dike. The reservoir is normally empty except for small sediment pools at the principal spillway inlets. These structures are owned by the State of Connecticut, Department of Environmental Protection.

Based on the visual inspection, review of design information and past operational performance, these structures are judged to be in GOOD condition. There is some erosion due to vehicle trespass, some sloughing of the embankments, and animal burrows.

These structures are classified as INTERMEDIATE in size and HIGH hazard potential structures in accordance with the Recommended Guidelines for Safety Inspection of Dams, by the Corps of Engineers. The impoundment storage at the top of the structures is 1205 ac.-ft.

Failure of any of the embankments could result in the possible loss of more than a few lives and extensive economic damage to numerous homes and buildings along the downstream channel in West Hartford. Depths of inundation at these homes and buildings may range from 2 to 10 feet in the event of failure of the Main Dam, from 4 to 12 feet in the event of failure of the Diversion Dike, and from 1 to 3 feet in the failure of the Dike No. 2.

The test flood is the Probable Maximum Flood (PMF). The test flood has an inflow equal to 4050 cfs and an outflow discharge equal to 2670 cfs at a stillwater elevation of 456.2 which will not overtop the dam (1.8 feet freeboard). -The maximum outflow capacity of the spillways with the water level at the top of the dam is 5400 cfs, which is 203 percent of the test flood outflow.

It is recommended that the following items be studied further by a qualified registered engineer: Investigate the cause of the holes at the outlet end of the emergency spillway and design repairs as necessary (Main Dam). Investigate the low spot in the top of the embankment in the vicinity of the bend between Stations 22 and 23 and design repairs as necessary (Diversion Dike). Investigate the discharge adequacy of the drainage channel which runs along the upstream side of the embankment along that portion adjacent to Route 44 (Diversion Dike). Investigate the erosion and sloughing around the outlet pipe and design repairs as necessary (Diversion Dike). Investigate the minor sloughing in the wet area at the downstream toe of the embankment in the vicinity of Station 8 and design repairs as necessary (Diversion Dike). The reservoir should be visited when flood waters are being impounded to check for problem areas (general).

The following remedial measures should be taken by the owner: Repair of minor sloughing at the outlet and monitoring of seepage throdugh the riprap at the outlet of the Main Dam. Repair of the erosion at the vent, removal of the brush from the riprap at the outlet and clear brush from the drainage channel along the upstream face adjacent to Route 44, at the Diversion Dike. Recreational vehicle access should be eliminated, vehicle ruts should be repaired, animal burrows should be filled, the semi-annual inspections continued, and the existing flood emergency plan amended to provide downstream warning procedures.

Recommendations and remedial measures that should be implemented within one year or two years, as noted, of receipt of this Phase I Inspection Report are further described in Section 7.

JAMES P. PURCELL ASSOCIATES, INC.

Director of Engineering
Connecticut P.E. No. 8012

PREFACE

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation, and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I Investigation. However, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there by any chance that unsafe conditions be detected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the spillway test flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. Because of the magnitude and rarity of such a storm event, a finding that a spillway will not pass the test flood should not be interpreted as necessarily posing a highly inadequate condition. The test flood provides a measure of relative need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and downstream damage potential.

The Phase I Investigation does not include an assessment of the need for fences, gates, no-trespassing signs, repairs to existing fences and railings and other items which may be needed to minimize trespass and provide greater security for the facility and safety to the public. An evaluation of the project for compliance with OSHA rules and regulations is also excluded.

PHASE I - INSPECTION REPORT

NAME OF DAM: TALCOTT RESERVOIR DAM
(Main Dam, Diversion Dike, Dike No. 2)

SECTION 1

PROJECT INFORMATION

1.1 General

a. Authority:

Public Law 92-367, August 8, 1972, authorized the Secretary of the Army through the Corps of Engineers to initiate a national program of dam inspections throughout the United States. The New England Division of the Corps of Engineers has been assigned the responsibility of supervising the inspection of dams within the New England Region. James P. Purcell Associates, Inc. has been retained by the New England Division to inspect and report on selected dams in the State of Connecticut. Authorization and notice to proceed was issued to James P. Purcell Associates, Inc., under a letter from William E. Hodgson, Jr., Colonel, Corps of Engineers. Contract No. DACW33-81-C-0009 has been assigned by the Corps of Engineers for this work.

b. Purpose:

1. Perform technical inspection and evaluation of non-federal dams to identify conditions which threaten the public safety and thus permit correction in a timely manner by non-federal interests.

2. Encourage and prepare the States to initiate quickly, effective dam safety programs for non-federal dams.

3. To update, verify and complete the National Inventory of Dams.

1.2 Description of Project

a. Location:

The Talcott Reservoir structures are located in the Town of West Hartford, Hartford County, Connecticut (See Plate No. 1).

The Diversion Dike is located on the south side of U.S. Route 44, approximately 2.8 miles east of the village of Avon. The dike is built across a tributary to Trout Brook and is located 4.4 miles upstream of the confluence with Trout Brook. The dike is at latitude 41°-47'-14" and longitude 72°-47'-06".

The Main Dam is located approximately 3000 feet due south of the Diversion Dike. The dam is built across a tributary to Trout Brook and is located 1700 feet upstream of Hartford Reservoir No. 2. The dam is at latitude 41°-46'-42" and longitude 72°-47'-10".

The Dike No. 2 is located across a small valley approximately 600 feet east of the east end of the Diversion Dike. The dike does not cross a water course but is used to contain flood waters within the reservoir. It is located at latitude 41°-47'-10" and latitude 72°-47'-10".

Trout Brook is a tributary to the south branch of the Park River which flows through Hartford, Connecticut to the Connecticut River.

All elevations used in this report are based on the Metropolitan District Commission (MDC) Datum, except as noted. The MDC Datum minus 2.08 feet equals the National Geodetic Vertical Datum (NVGD).

b. Description of Dam and Appurtenances:

The Talcott Reservoir Project consists of a Main Dam, a Diversion Dike and the Dike No. 2. They are all earth embankments with good grass covers, a top width of 12 feet at elevation 458.0 and side slopes of 3H:1V.

The Main Dam is 1300 feet long and 30.0 feet high. It has an embankment and foundation drain along the downstream toe in the vicinity of the outlet. The Main Dam is unzoned compacted earth fill with a 12 foot wide cutoff trench.

The Diversion Dike is 3125 feet long and 30.0 feet high. It has an embankment and foundation drain along the downstream toe in the vicinity of the outlet and at the northern end of the dike. Approximately 1200 feet of the dike was constructed partially of rockfill with an impervious upstream face and top. There is a two layer granular filter on the upstream face of the rockfill. The remainder of the dike is unzoned compacted earth fill. There is a 12 foot wide cutoff trench.

The Dike No. 2 is 210 feet long and 18.5 feet high. It has a filter blanket seepage drain along the downstream toe. There is a 12 foot wide cutoff trench.

The outlet works consist of a principal spillway and an emergency spillway at the Main Dam and the Diversion Dike. There are no outlet works at the Dike No. 2. Both principal spillways consist of reinforced concrete risers and a 30 inch reinforced concrete pipe extending from the riser, through the embankments, to a free outlet at the downstream face. Flow into these 30 inch pipes is restricted by steel oriface plates attached to the upstream end of the pipes. This was done in order to achieve the desired outflow rates with use of the 30 inch pipes required for internal inspection. The crest of the risers are at elevation 435.0 and are protected by angle iron trash racks. The pipes are vented by a 4 inch diameter steel pipe extending to elevation 452.5. There are no drains into the risers and the small sediment pools cannot be emptied.

The emergency spillways are grassed earth channels at the eastern end of the Diversion Dike and the eastern third of the Main Dam. The crests of the spillways are 30 foot long level sections at elevation 452.5. The bottom widths are 40 feet at the Main Dam and 90 feet at the Diversion Dike, and the side slopes are 3H:1V. The lengths of the spillways are 300 feet at the Main Dam and 500 feet at the Diversion Dike.

c. Size Classification:

The size classifications of all three structures are INTERMEDIATE as per criteria set forth in the Recommended Guidelines for Safety Inspection of Dams by the Corps of Engineers. The impoundment storage at the top of all three structures is 1205 acre-feet (within the range of 1000 to 50,000 ac.-ft.). The maximum height of the Main Dam is 30.0 feet (within the range of 25 to 40 feet-small classification), of the Diversion Dike is 30.0 feet (within the range of 25 to 40 feet-small classification) and of the Dike No. 2 is 18.5 feet (range 25 to 40 feet-small classification). The size classifications of these structures is based on the impoundment storage criteria.

d. Hazard Classification:

The hazard classifications for all three structures are HIGH as per the criteria set forth in the Recommended Guidelines for Safety Inspection of Dams, by the Corps of Engineers.

In the event of failure of any of the structures, numerous homes and buildings in an urbanized area of West Hartford could suffer excessive damage. The potential exists for the loss of more than a few lives at numerous downstream homes.

Depths of inundation at these homes and buildings may range from 2 to 10 feet in the event of failure of the Main Dam, from 4 to 12 feet in the event of failure of the Diversion Dike, and from 1 to 3 feet in the failure of the Dike No. 2. No homes would be inundated by pre-failure flows. These homes and buildings range from approximately 0 to 10 feet above normal brook levels.

e. Ownership:

The Talcott Reservoir structures are presently owned and maintained by: The State of Connecticut, Department of Environmental Protection.

f. Operator:

The person in charge of maintenance of the structures is:

Mr. Anthony Cantele
Regional Director, Region I
Conservation and Preservation Division
Department of Environmental Protection
P.O. Box 161
Pleasant Valley, Connecticut 06063
Telephone: (203) 379-0771

g. Purpose:

These floodwater retarding structures provide flood protection to the flood plain on the South Branch of the Park River.

h. Design and Construction History:

The design of the project was completed by the Soil Conservation Service in 1963 and construction was completed in 1964.

i. Normal Operating Procedures:

There are no day-to-day operational procedures for these structures. The reservoir is normally empty except for small sediment pools around the principal spillway risers and all flow is discharged through the two principal spillways.

1.3 Pertinent Data

a. Drainage Area:

The Talcott Reservoir drainage basin is irregular in shape with a total drainage area of 1.6 square miles (see drainage area map in Appendix D). The topography is generally rolling terrain with elevations ranging from a high of 820 feet to a low of 435.0 feet at the principal spillway crests. Stream and basin slopes are moderate, 5 percent and 10 percent, respectively. The sediment pools occupy a negligible portion of the watershed, however, approximately 25 acres between the Main Dam and Diversion Dike consist of a shallow swamp at elevation 435.0.

b. Discharge at Dam Site:

There are no specific discharge records available. Listed below are calculated discharge values of the emergency spillways and outlet works (30 inch principal spillways).

1. Outlet Works: Two 30 inch pipes with inverts at elevation 431.0 and a total discharge capacity of 120 cfs at elevation 452.5.

2. Maximum known discharge at dam site: Unknown.

3. Ungated spillway capacity at top of dam: 1760 cfs (Main Dam) and 3500 cfs (Diversion Dike) at elevation 458.0.

4. Ungated spillway capacity at test flood elevation: 860 cfs (Main Dam) and 1680 cfs (Diversion Dike) at elevation 456.2.

5. Gated spillway capacity at normal pool elevation: N/A

6. Gated spillway capacity at test flood elevation: N/A

7. Total spillway capacity at test flood elevation: 860 cfs (Main Dam) and 1680 cfs (Diversion Dike) at elevation 456.2.

8. Total project discharge at top of dam: 5400 cfs at elevation 458.0.

9. Total project discharge at test flood level: 2670 cfs at elevation 456.2.

c.	**Elevation (Feet Above MDC Datum):**	
	1. Stream bed at toe	428.0 (Main Dam) 428.0 (Diversion Dike) 439.5 (Dike No. 2)

SECTION 2

ENGINEERING DATA

2.1 Design

The available design data consists of the following documents and plans prepared by the Soil Conservation Service.

a. "As-built" drawings of the construction plans, Talcott Reservoir Dam, 1963. Copies of these plans are included in Appendix B-3.

b. Original design calculations and report.

c. Stage-storage, stage-reservoir area, and stage-discharge curves.

d. Information storage and retrieval form.

Refer to Appendix B-1 for location of this material.

2.2 Construction

The SCS provided inspection during construction of the structures, which was completed in 1964. The SCS has construction inspection reports in storage. These reports were not reviewed in the preparation of this Phase I Inspection Report.

2.3 Operation

There is no day-to-day operational procedures. The site is visually inspected semi-annually by the State of Connecticut. Inspection records are available from the owners.

2.4 Evaluation

a. Availability:

All information concerning these structures was gathered by field investigation and meetings with the Soil Conservation Service and from the files of the Department of Environmental Protection, Water Resources Unit, Dam Safety Engineers, State Office Building, Hartford, Connecticut.

b. Adequacy:

The information that was available complimented a complete visual inspection of this facility and is adequate at this time.

c. Validity:

The engineering design data provided by the SCS has been deemed adequate for the purpose of this Phase I Inspection Report. The as-built plans appear to adequately represent the present configuration of the structures based upon the visual inspection. This investigation did not include a detailed engineering check of the SCS design file.

SECTION 3

VISUAL INSPECTION

3.1 Findings

a. General:

The visual inspection of the Talcott Reservoir Structures was conducted on November 17, 1980 and a copy of the visual inspection check list is contained in Appendix A of this report.

The following procedure was used:

1. Inspection of the upstream reservoir area which would be impounded by the dam and dikes.

2. Visual inspection of the face and top of the dam, dikes and spillways for cracks, settlement, seepage, etc.

3. Inspection of the outlet works and other appurtenances as to their existence, location and operability.

4. Review of procedures that could be utilized in the event of an emergency situation.

5. A check of the downstream area for seepage, piping, boils or other indications of abnormal conditions. The downstream hazard potential in the event of dam or dike failure was investigated.

6. Photographs of the general area of the dam and of specific items of note were taken and are included in Appendix C of this report.

   Before the inspection, the available existing data was studied and reviewed.

b. Main Dam and Appurtenant Structures:

1. Crest: The dam consists of an earth embankment with no evidence of misalignment or settlement. The top of the dam is 12 feet wide and contains a grassed service road. There are wheel ruts and foot paths along the top of the dam, but no bare earth is exposed (Photo C-1).

2. Upstream Face: The upstream face consists of a grassed earth slope (Photos C-2, C-4). Only a few

small animal burrows, approximately 1 inch in diameter, were noted. Some slightly larger animal burrows were noted in the upstream toe approximately 100-150 feet west of the emergency spillway.

3. Downstream Face: The downstream face is an earth slope with a good grass cover (Photo C-3). Numerous large animal burrows were noted all along the toe of the embankment. These burrows were up to 6 inches in diameter. There are several large holes associated with animal burrows at the joint between the embankment and west emergency spillway embankment. The largest of these is shown in Photo C-7 and is approximately 2 feet in diameter. Minor sloughing is occurring around the outlet pipe.

4. Principal Spillway: The principal spillway consists of reinforced concrete riser and uncontrolled 30 inch reinforced concrete pipe extending through the dam. These concrete structures are in good condition. The inside dimensions of the riser are 3.5 feet by 4 feet. The riser is protected by an angle iron trash rack (Photo C-8). The pipe outlets to a riprap stilling pool (Photo C-10). There is standing water in the riprap at the outlet (Photo C-9) which is approximately 1 foot higher than the stilling pool.

5. Emergency Spillway: The emergency spillway is a 40 foot wide grassed channel with side slopes of 3H:IV and is approximately 300 feet long (Photo C-5). There are vehicle ruts with some bare earth in places on the floor and sides of the channel.

   Several large holes were noted in the floor of the channel at the downstream end (Photo C-6). These appear to contain animal burrows at the bottom. The largest hole is 3 feet deep and approximately 7 feet by 10 feet wide. The downstream floor of the spillway ends at a 2H:1V slope down to existing woodland. This slope is vegetated with brush and small trees. The spillway floor appears to have been extended downstream in this area (Overview Photo).

c. Diversion Dike and Appurtenant Structures:

1. Crest: The dike consists of an earth embankment with no evidence of misalignment (Photos C-11, C-16, C-17). There is an area of possible settlement (8 inches maximum) of the upstream edge of the top of the dike at approximately Station

22+50. There are wheel ruts all along the top with bare earth in places (Photo C-12). The top width is 12 feet.

2. Upstream Face: The upstream face is a grassed earth slope (Photos C-11, C-15, C-17). An erosion gully (up to 1.0 foot deep by 1.5 feet wide) has formed below a concrete pad next to the principal spillway vent inlet (Photo C-19).

   There is an overgrown channel along the upstream side of the dike at the northern end which carries water from north of Route 44 into the reservoir (Photo C-11). The upper portion of this channel is higher than the top of the dike and it appears possible that high discharges could flow both in the channel and over the top of the dike. The as-built plans indicate a 10 foot wide trapezoidal channel approximately 2 to 3 feet deep.

3. Downstream Face: The downstream face is a grassed earth slope (Photos C-14, C-16). There is an area of possible seepage (no visible flow) and minor sloughing at the base of the embankment at approximately Station 8 (Photo C-13). There are numerous small animal burrows and riprap outcrops along the rockfill area between Stations 10 and 22 (Photo C-14). Sloughing is occurring at the riprap around the principal spillway outlet (Photo C-21).

4. Principal Spillway: The principal spillway consists of a reinforced concrete riser and uncontrolled 30 inch reinforced concrete pipe extending through the Dike. These concrete structures are in good condition. The inside dimensions of the riser are 3.5 feet by 4 feet. The riser is protected by an angle iron trash rack (Photo C-20). The pipe outlets to a riprap stilling pool (Photo C-22).

5. Emergency Spillway: The emergency spillway is a 90 foot wide grassed channel with side slopes of 3H:1V and is approximately 500 feet long (Photo C-18). There are vehicle ruts on the floor and sides of the channel (Photo C-17). There is a damp area with cattails in the floor along the toe of the eastern embankment near the downstream end. This is probably due to groundwater seepage from the hillside in which the easterly spillway wall was excavated. Although damp, no moving water was noted in this area during the inspection.

d. Dike No. 2:

1. Crest: The dike consists of an earth embankment with no evidence of misalignment or settlement (Photo C-23). The top is 12 feet wide and contains only minor wheel paths.
2. Upstream Face: The upstream face is a grassed earth slope (Photo C-24). No animal burrows or erosion were noted.
3. Downstream face: The downstream face is a grassed earth slope (Photo C-23). No animal burrows or erosion were noted.

e. Reservoir Area:

There is no permanent reservoir except for small sediment pools at each principal spillway inlet. The majority of the reservoir area is woodland. There is a 25 acre swamp between the Main Dam and Diversion Dike (Overview Photo). No unusual geological features were noted that could be expected to adversely affect the embankments or appurtenant structures.

f. Downstream Channel:

The downstream channels consist of short excavated earth channels which extend to existing streams (Photo C-10, Main Dam) (Photo C-22, Diversion Dike).

3.2 Evaluation

Based on the visual inspection, the Talcott Reservoir structures appear to be in GOOD condition overall and there were no major areas of distress noted. Specific areas of concern that were noted are:

a. The erosion due to vehicle trespass.

b. The animal burrows in the embankments.

c. The apparent inadequacy of the discharge capacity of the channel at the north end of the Diversion Dike.

d. The sloughing of the downstream face of the Diversion Dike around the outlet and the minor sloughing near Station 8.

e. The holes in the downstream end of the emergency spillway at the Main Dam.

It should be noted that this floodwater retarding reservoir was not filled at the time of inspection and

thus the adequacy of the structure with regard to the functioning of the blanket and toe drain and also with regard to potential seepage problems could not be fully assessed. The reservoir should be visited by a qualfied registered engineer when floodwaters are being impounded to check for problem areas. A record of maximum water levels should be kept fo: reference purposes.

SECTION 4

OPERATIONAL AND MAINTENANCE PROCEDURES

4.1 Operational Procedures

a. General:

There are presently no formal operational procedures for this facility.

b. Description of Any Warning System in Effect:

There is a formal written "Flood Emergency Plan" in effect for this facility. During a flood "watch", the structures are inspected to insure that the outlets are clear and free of debris. During a flood "warning", State personnel visit the site periodically (2-3 hours) and report on unusual situations. In the event of an emergency situation, the field inspector would call the State Dam Safety Engineer and a decision would be made as to further action to be taken. A copy of the applicable portions of this flood emergency plan is included in Appendix B.

4.2 Maintenance Procedures

a. General:

The grass cover is mowed on an annual basis. Other maintenance such as painting the track racks and repairing erosion areas is performed on an "as needed" basis based on the findings of the semi-annual inspections.

b. Operating Facilities:

Maintenance of the principal and emergency spillways is as described above in Paragraph 4.2a.

4.3 Evaluation

The operational and maintenance procedures are generally satisfactory, but there are areas requiring improvement.

The formal written flood emergency plan should be amended to include downstream warning procedures.

SECTION 5

EVALUATION OF HYDRAULIC/HYDROLOGIC FEATURES

5.1 General

The Talcott Reservoir structures will create an impoundment with a total storage capacity of 826 ac.-ft. at elevation 452.5, the emergency spillway crest elevation. Each foot of depth in the reservoir above the emergency spillway crest can accommodate approximately 66 ac.-ft. The emergency spillways are grassed earth channels with a total width of 130 feet and a crest 5.5 feet below the top of the dam. The drainage area is 1.61 square miles and stream and basin slopes are moderate, 5 percent to 10 pecent, respectively.

5.2 Design Data

a. Original design data (Standard SCS Design Methods) is available for this watershed and the structures of the Talcott Reservoir. To verify existing design information, USGS topographic maps (Scale 1" = 2000') were utilized to develop hydrologic parameters such as drainage area, basin length, time of concentration, and other runoff characteristics. Surface area and storage values were verified and taken from the original design data. Some of the pertinent hydraulic design data was confirmed by actual field measurements at the time of visual inspection.

b. The original design discharge for the facility is 1780 cfs with a corresponding freeboard of 2.5 feet.

c. Outflow values (routing procedures) and dam overtopping analyses were computed in accordance with the guidelines developed by the Corps of Engineers. Judgment was used in calculating final values outlined in this report, which are quite approximate and should not be considered a substitute for actual detailed analysis.

5.3 Experience Data

Historical data for recorded reservoir levels is not available for this dam.

5.4 Test Flood Analysis

Recommended Guidelines for the Safety of Dams by the Corps of Engineers were used for the selection of the "Test Flood". This project is classified as HIGH hazard and INTERMEDIATE size. Guidelines indicate that the Probable

Maximum Flood (PMF) be used as the "Test Flood" for these classifications. The watershed has a total area of 1.61 square miles. Snyder's lag was calculated to be 2.9 hours and a Snyder peaking coefficient of 0.625 was used. The 200 square mile - 24 hour Probable Maximum Precipitation (PMP) is 21.5 inches. The flood hydrograph package, HEC-1 computer program, developed by the Corps of Engineers was utilized to develop the inflow hydrograph, route the flood through the reservoir and for the dam overtopping analysis. A "Test Flood" inflow equal to the PMF was calculated to be 4050 cfs (2510 csm) and 1/2 the PMF has an inflow value of 2020 cfs (1260 csm).

The emergency spillway capacity is hydraulically adequate to pass the "Test Flood" (PMF) and overtopping of the structures will not occur. The maximum outflow capacity of the project without overtopping the structures is 5400 cfs. This corresponds to 203 percent of the test flood outflow. The maximum outflow discharge value for the "Test Flood" is 2670 cfs corresponding to a depth of flow over the emergency spillways of 3.7 feet and a freeboard of 1.8 feet. A spillway rating curve, outlet rating curve and a stage-storage curve are included in Appendix D of this report.

At the emergency spillway crest elevation of 452.5, the capacity of the two 30 inch outlet structures is 120 cfs. It will require approximately 5.5 days to empty the reservoir assuming a water surface initially at the emergency spillway crest.

The reservoir was assumed to be initially empty for the test flood analysis. It was also assumed that no blockage of the spillways occurred. The affect of tailwater was not considered.

5.5 Dam Failure Analysis

a. General:

These structures are classified as HIGH hazard structures. Failure discharge could cause damage and the possible loss of more than a few lives due to high velocities, impact from debris, and flooding to numerous residential homes and buildings along the downstream channels in West Hartford. These homes and buildings range from approximately 0 feet to 10 feet above normal brook levels.

The calculated failure discharges are 28,000 cfs (Main Dam), 57,000 cfs (Diversion Dike) and 4200 cfs (Dike No. 2) at pool levels equal to the emergency spillway crest. The assumed breach lengths are 140 feet (Main Dam), 280 feet (Diversion Dike) and 50 feet (Dike No.

2). Water surface elevations due to structure failure are listed in Appendix D on Pages D-19, D-29 and D-39.

b. Main Dam:

The pre-failure flow downstream would be the principal spillway flow of 75 cfs, corresponding to a depth of flow of approximately 2 feet. No structures would be inundated by this pre-failure flow. The failure impact area has been extended downstream 29,000 feet to North Main Street. Numerous homes in this impact area may be inundated by from 2 to 10 feet above ground level. Hartford Reservoirs Nos. 2, 5 and 1 may be overtopped by failure of the Main Dam. Additional damage is possible downstream.

c. Diversion Dike:

The pre-failure flow downstream would be the principal spillway flow of 45 cfs (lower than Main Dam flow due to oriface plates), corresponding to a depth of flow of approximately 2 feet. No structures would be inundated by this pre-failure flow. The failure impact area has been extended downstream 20,000 feet to North Main Street. Numerous homes in this impact area may be inudated by from 1 to 3 feet above ground level. Additional damage is possible downstream.

d. Dike No. 2:

There would be no pre-failure flow for the dike. The failure impact area has been extended downstream 19,000 feet to North Main Street. Numerous homes in this impact area may be inundated by from 1 to 3 feet above ground level. Additional damage is possible downstream.

SECTION 6

EVALUATION OF STRUCTURAL STABILITY

6.1 Visual Observation

a. General:

The visual inspection revealed no signs of major physical distress. It should be noted that this floodwater retarding reservoir was not filled at the time of inspection and thus the adequacy of the structures with regard to the functioning of the blanket and toe drains and also with regard to potential seepage problems could not be fully assessed.

b. Main Dam:

The earth embankment and emergency spillway appear in good general condition. The top is level and the embankment faces are well vegetated and appear stable.

There is a series of large holes on the floor of the emergency spillway near the discharge end. These range in size up to 7 feet by 10 feet in area and 3 feet deep. These large holes appear to have animal holes at their bottom. Several other large animal burrows were noted on the embankment.

c. Diversion Dike:

The earth embankment and emergency spillway appear in good general condition. The most significant visual observations related to the stability of the embankment are the apparent 8 inch low spots in the embankment crest in the vicinity of Stations 22 and 23 and the headward erosion of the toe of the embankment in the area of the 30 inch RCP outlet pipe and cradle.

d. Dike No. 2:

The earth embankment appears in good general condition. The top is level and the embankment faces are well vegetated and appear stable.

6.2 Design and Construction

The design information available consists of the design calculations and report, as-built construction plans, and construction reports. The location of this information is given in Appendix B-1.

6.3 Post-Construction Changes

There have been no post-construction changes to the structures since completion in 1964.

6.4 Seismic Stability

The structures are in Seismic Zone 1 and hence do not require evaluation for seismic stability according to the Corps of Engineers Recommended Guidelines.

SECTION 7

ASSESSMENT, RECOMMENDATIONS AND REMEDIAL MEASURES

7.1 Dam Assessment

a. Condition:

Based on the visual inspection, past performance and hydraulic/hydrologic evaluation, the Talcott Reservoir structures and appurtenances are judged to be generally in GOOD condition. Items of concern that should be addressed as a result of this inspection are listed in Sections 7.2 and 7.3

b. Adequacy:

The information available is such that the assessment of the safety of the structures should be based on the visual inspection results, the past operational performance and the design information that is available.

c. Urgency:

The recommendations and remedial measures described below should be implemented by the owner within two years after receipt of this Phase I Inspection Report, except as noted.

7.2 Recommendations

It is recommended that the owner engage a qualified registered engineer to carry out the following actions and that his recommendations be implemented.

a. Main Dam:

1. Investigate the cause of the holes at the outlet end of the emergency spillway and design repairs as necessary within one year.

b. Diversion Dike:

1. Investigate the low spot in the top of the embankment in the vicinity of bend between Stations 22 and 23 and design repairs as necessary.

2. Investigate the discharge adequacy of the drainage channel which runs along the upstream side of the embankment along that portion adjacent to Route 44 within one year.

3. Investigate the erosion and sloughing around the outlet pipe and design repairs as necessary within one year.

4. Investigate the minor sloughing in the wet area at the downstream toe of the embankment in the vicinity of Station 8 and design repairs as necessary.

c. General:

1. The reservoir should be visited when floodwaters are being impounded to check for problem areas. A record of maximum water levels should be kept for reference purposes.

7.3 Remedial Measures (Operation and Maintenance Procedures)

a. Main Dam:

1. Repair the minor sloughing in the vicinity of the outlet pipe and cradle, and cut the brush in the riprap in this area.

2. Monitor the seepage through the riprap area at the outlet pipe.

b. Diversion Dike:

1. Repair the erosion gully on the upstream face which originates from the concrete pad below the vent pipe.

2. Remove all brush from the riprapped stilling pool.

3. Clear the brush from the drainage channel along the upstream side of the embankment along that portion adjacent to Route 44.

c. General:

1. Repair vehicle tracks and footpaths on the embankments and emergency spillways.

2. During the semi-annual inspections, identify all animal burrows and repair as necessary.

3. Recreational vehicle access to the structures should be eliminated.

4. Continue the semi-annual technical inspection program.

5. The existing formal written flood emergency plan should be amended to include downstream warning procedures.

7.4 Alternatives

There are no practical alternatives to the above stated recommendations.

DESIGN REPORT

SOUTH BRANCH PARK RIVER WATERSHED
SITE NO. 1, TALCOTT RESERVOIR
HARTFORD COUNTY, CONNECTICUT

This project is located in Hartford County, in West Hartford, Connecticut. The transparent overlay (sheet 4 of this report) together with the Avon, Connecticut quadrangle published by the U.S. Geological Survey, may be used to locate the site.

This is a class (c) flood prevention project (see Washington Engineering Memorandum SCS-27) and was designed in accordance with Soil Conservation Service criteria.

The project is composed of a diversion channel and four embankments, referred to as:

1. Main dam
2. Diversion dike
3. Dike No. 2
4. Low flow barrier

The embankments are earthfill with cutoff trenches to dense glacial material or rock. They contain drainage systems consisting of blanket type embankment drains and foundation toe drains.

The diversion channel diverts the flow from a drainage area of 1.07 square miles into the reservoir area.

The purpose of this project is to reduce flooding downstream by providing temporary storage for the runoff from 1.60 square miles. The temporary storage is released gradually thru two principal spillway systems.

Each principal spillway system utilizes a 3.5' x 4' reinforced concrete riser and a 30-inch reinforced concrete water pipe which has a vented orifice restriction at the inlet to the pipe. A low flow barrier in the channel between the main dam and the diversion dike forces the majority of the base flow thru the auxiliary principal spillway in the diversion dike.

There are two emergency spillways consisting of a 90-foot wide spillway cut thru the right abutment of the diversion dike and a 40-foot wide spillway of compacted fill on the left abutment of the main dam. The emergency spillways will not operate until the runoff exceeds 12 inches from a storm pattern similar to that caused by hurricane "Diane."

The inflow hydrographs used in the design of these structures were developed by the method described in the National Engineering Handbook, Section 4, Hydrology. The flood routing procedure used in the design is given in the National Engineering Handbook, Section 5, Hydraulics.

19. EARTHQUAKE ZONE 2/ (0, 1, 2, 3, or 4) 1

SIZE AND CAPACITY

20. DRAINAGE AREA UNCONTROLLED 1030 AC.
(UPSTREAM FROM STRUCTURE)
21. DRAINAGE AREA CONTROLLED ——— AC.
(UPSTREAM FROM STRUCTURE)
22. MAXIMUM FILL HEIGHT 27 FT.
(FROM LOW POINT ON CENTERLINE, BEFORE EXCAVATING, TO TOP OF SETTLED FILL.)
23. CREST LENGTH OF DAM (ALONG CENTERLINE) Dam 1300 / Dike 3125 FT.
24. VOLUME OF FILL 132,000 CU. YD.

25. SUBMERGED SEDIMENT STORAGE 2.6 AC
26. AERATED SEDIMENT STORAGE ——— AC
27. MUNICIPAL AND INDUSTRIAL WATER STORAGE ——— AC
28. RECREATION WATER STORAGE ——— AC
29. FISH AND WILDLIFE STORAGE ——— AC
30. IRRIGATION STORAGE ——— AC.
31. OTHER BENEFICIAL STORAGE ——— AC.
32. TOTAL FLOOD STORAGE 820 AC.
33. TEMPORARY EMERGENCY SPILLWAY STORAGE (BETWEEN CREST OF LOWEST EMERGENCY SPILLWAY AND TOP OF SETTLED FILL)
379 AC.
34. SURFACE AREA OF NORMAL POOL ——— AC.
35. LENGTH OF SHORE LINE OF NORMAL POOL ——— MILES
36. MAXIMUM DEPTH OF NORMAL POOL ——— FT.

PRINCIPAL SPILLWAY FEATURES

37. PRINCIPAL SPILLWAY TYPE (CIRCLE APPLICABLE) -
(PIPE), MONOLITHIC, OPEN CONCRETE STRUCTURE, OTHER
38. IS THERE COLD WATER RELEASE FACILITY? No
39. NUMBER OF STAGES 1 (1 or 2)
40. LOW STAGE CAPACITY ——— CFS
(AT HIGH STAGE PRINCIPAL SPILLWAY CREST)
41. PRINCIPAL SPILLWAY CAPACITY 129 CFS
(AT LOWEST EMERGENCY SPILLWAY CREST)

PRINCIPAL SPILLWAY CONDUIT FEATURES

42. MAJOR PORTION OF CONDUIT IS ON (CIRCLE APPLICABLE) -
ROCK OR (EARTH)
43. TYPE OF ENERGY DISSIPATOR (CIRCLE APPLICABLE) -
IMPACT BASIN, SAF, (PLUNGE POOL) NONE, OTHER
44. CONDUIT SIZE 2.5' (Two)
(LARGEST CONDUIT THROUGH DAM) (DIAM. IN FT. IF ROUND) (HEIGHT AND WIDTH IN FT. IF MONOLITHIC) ALSO SHOW NUMBER OF BARRELS IF MULTI-BARREL
45. INLET TYPE (CIRCLE APPLICABLE) - (CONCRETE-OPEN TOP)
COVERED TOP, HOOD INLET, METAL-OPEN TOP, OTHER
46. HEIGHT OF RISER 4.0 FT.
(FROM TOP OF FLOOR TO TOP OF ANTI-VORTEX)

EMERGENCY SPILLWAY FEATURES

47. PRIMARY EMERGENCY SPILLWAY TYPE (CIRCLE APPLICABLE)
CLOSED CONDUIT, OPEN CONCRETE STRUCTURE, EARTH, VEGETATED, SOFT ROCK, HARD ROCK 3/
48. PRIMARY EMERGENCY SPILLWAY WIDTH 130 ** FT.
(CREST LENGTH FOR CONCRETE)
49. 1 %
PERCENT CHANCE OF USE OF PRIMARY EMERGENCY SPILLWAY

1/ N. M. Fenneman, 1938, Physiography of Eastern United States, McGraw Hill Book Co., New York, N. Y.

2/ See TSC Technical Note - Engineering UD-22.

3/ Soft Rock - Rock that will erode when subjected to flowing water.
Hard Rock - Rock that is resistant to erosion due to flowing water.

EMERGENCY SPILLWAY FEATURES (CONT'D.)

50. 4906 CFS
CAPACITY OF PRIMARY EMERGENCY SPILLWAY (WHEN POOL IS AT TOP OF DAM)

51. 5.5 FT.
DIFFERENCE IN ELEVATION BETWEEN CREST OF PRIMARY EMERGENCY SPILLWAY AND TOP OF DAM

52. SECONDARY EMERGENCY SPILLWAY IS (CIRCLE APPLICABLE)
NONE/ EARTH, VEGETATED, SOFT ROCK, HARD ROCK 3/

53. WIDTH OF SECONDARY EMERGENCY SPILLWAY — FT.

54. CAPACITY OF SECONDARY EMERGENCY — CFS
SPILLWAY (WHEN POOL IS AT TOP OF DAM)

55. — FT.
DIFFERENCE IN ELEVATION BETWEEN CREST OF SECONDARY EMERGENCY SPILLWAY AND TOP OF DAM

OMIT ITEMS 56-59 IF DRAINAGE AREA IS LESS THAN 10 SQUARE MILES

56. BULK LENGTH OF SOFT ROCK 3/ EARTH — FT.
OR VEGETATED SPILLWAY (SEE TR-52 FOR DEFINITION)

57. —
PT OF SURFACE MATERIAL IN EARTH OR VEGETATED SPILLWAY (PREDOMINANT MATERIAL AT OR NEAR SURFACE BEFORE TOP SOILING)

58. —
USCS CLASSIFICATION OF ABOVE MATERIAL

59. — AC. FT.
VOLUME OF OUTFLOW THROUGH VEGETATED OR EARTH SPILLWAY (DURING PASSAGE OF FREEBOARD HYDROGRAPH)

76. REMARKS * Structure designed with two (2) principal spillways. One in the dam and one in the dike.
** Two Emergency Spillways - one 90' B.W. and one 40' B.W.

3/ Soft Rock - Rock that will erode when subjected to flowing water.
Hard Rock - Rock that is resistant to erosion due to flowing water.

FLOOD EMERGENCY PLAN PP 6
CONN. DEPT. ENVIR. PROT.

will commence. The pump and hoses are stored in Building No. 17.

d. All gates will be inspected to insure proper closing without clogging by debris.

e. Screen well house openings will be closed. The closure will consist of

(i) stoplogging the one entrance door into the structure,

(ii) closing the maintenance trough opening with the steel plate mounted outside the building, and

(iii) the sluice gate on the opening under the well house floor will be secured.

The flood works are on the property of Chase Brass and Cooper Co., Inc., and AMTRAK. Chase Brass has agreed to assist in maintaining and operating these works. The individuals assigned to these responsibilities from Chase Brass are as follows:

L. Conard	756-9448
B. Kleinselbeck	754-8229

(A guard is on duty 24 hours at the plant.)

5. Soil Conservation Service Flood Control Structures: The dams listed below are dry flood control dams which are owned and operated by the State of Connecticut. Their sole purpose is to impound and slowly release flood water. In order to properly operate, it is imperative the culverts be clear and free of debris. For this reason, upon notification of a watch the structures should be inspected to insure clear outlets. During a warning the dams will be inspected at approximately 2 - 3 hour intervals. Inspections should consist of

a. estimating the height of water,

b. looking for piping failures, sand boils, or other abnormal leakage, especially in the vicinity of the culvert outlets, and

c. looking for the development of slope sloughing or other structural problems.

Findings of each inspection should be reported immediately to the F.E.O.C.

FLOOD EMERGENCY PLAN PP 7
CONN. DEPT. ENVIR PROT.

Crew Assignments:

Bloomfield Reservoir, Site 3, Tunxis Ave. Bloomfield

Bloomfield Reservoir, Site 3a, Tunxis Ave., Bloomfield

HYDROLOGIC AND HYDRAULIC ANALYSIS
SUMMARY SHEET

Dam Talcott Reservoir

Test Flood PMF

INFLOW HYDROGRAPH DEVELOPMENT

Drainage Area 1.61 sq. mi.

Probable Maximum Precipation
24 hour - 200 square mile PMP 21.5 inches

Initial Railfall Loss 0 Inch
Uniform Railfall loss .1 Inch

Snyder's Lag 2.9 hours
Snyder's Peaking Coefficient .625

Test Flood Inflow 4047 CFS

PMF Inflow 4047 CFS

RESERVOIR ROUTING AND DAM OVERTOPPING

Test Flood Outflow 2666 CFS

Spillway Capacity at Top of Dam 5400 CFS (All spillways)
203 % of Test Flood

Flow Over Spillway at Test Flood 2535 CFS (Both Emergency Spillways)

Spillway Crest Elevation 452.5 Feet (Emergency Spillways)
Top of Dam Elevation 458.0 Feet
Test Flood Elevation 456.24 Feet

Talcott Reservoir - Main Dam

Dam Failure Analysis

1. Failure discharge with pool at Em.Spillway (elev. 452.5) = 28000 CFS
2. Depth of water in reservoir at time of failure = 24.5 ft.
3. Maximum depth of flow downstream of dam = 24± ft.
4. Water surface elevation just downstream of dam at time of failure) = 452±

The failure discharge of 28000 CFS will enter and flow downstream 29000 feet until the brook crosses North Main Street. Valley storage in this 29000 feet length of brook is significant in reducing the discharge. Also due to roughness characteristics, obstructions and frictional losses, it is very likely that the unsteady dam failure flow will dissipate its wave and kinetic energy and thus convert to steady and uniform flow obeying Manning's formulae 29000 feet downstream. The failure profile will have the following hydraulic characteristics:

DISTANCE FROM THE DAM	WATER SURFACE ELEVATION	DEPTH (ft.)	REMARKS
0	452.5	24.5	At Dam
1600	397.8	7.8	
7500	323.8	3.8	Hartford Res. No. 5
11800	260.7	2.7	Hartford Res. No. 1
19000	142.2	2.2	
25000	131.7	1.7	
29000	102.±	2±	North Main Street

NOTES:

"Rule of Thumb" Guidance for Estimating
Downstream Dam Failure Analysis

DATA

Name of Dam Talcott Reservoir - Main Dam

Location West Hartford, Connecticut

Drainage Area 1.6 sq. mi., Top of Dam 458.0

Spillway Type Grassed Channel, Crest of Spillway 452.5

Surface Area @ Crest Elev. 65.7 Acres = 0.10 sq. mi.

Pool Bottom Near Dam = 428.0

Assumed Side Slopes of Embankments = 2H:1V

Depth of Pool at Dam (Yo) = 24.5 Feet

Mid-Height Elev. 440.2

Length of Dam at Crest = 1325 Feet

Length of Dam at Mid-Height = 350 Feet

40 % of Dam Length at Mid-Height = W_b = 140 Feet

Step 1

Storage (S) at time of failure 826 Ac-FT

Step 2

Peak Failure Discharge

$Q_{pl} = 8/27\ W_b\ \sqrt{g}\ Yo^{3/2}$

$= (1.68)\ (^{W}b)\ (^{Y}o)^{3/2} =$ 28000 cfs

Failure is assumed to coincide with pool elevation at Emergency Spillway Crest

Talcott Reservoir - Main Dam

A. Size Classification

Height of dam = 30.0 ft.; hence Small

Storage capacity at top of dam (elev. 458.0) = 1205 AC-FT.; hence intermediate

Adopted size classification: intermediate

B.i) Hazard Potential

The potential exists for the loss of more than a few lives and excessive economic damage at numerous homes and buildings in West Hartford.

Adopted hazard classification: High

ii) Impact of Failure of Dam with pool at Em. Spillway Crest

It is estimated from the "rule of thumb" failure hydrograph, that the following adverse impacts are a possibility by the failure of this dam.

a) Loss of homes 20+;
b) Loss of buildings 10+;
c) Loss of highways or roads 8;
d) Loss of bridges 6;

The failure profile can affect a distance of 29000 feet from the dam.

C. Hazard Potential Classifications

HAZARD	SIZE	TEST FLOOD RANGE
High	Intermediate	PMF

Adopted Test Flood = PMF = 2510 CSM

= 4047 CFS

D. Overtopping Potential

Drainage Area 1030 acres = 1.61 sq. miles

Spillway crest elevation = 452.5

Top of Dam Elevation = 458.0

Maximum spillway discharge

Capacity without overtopping of dam = 5400 (Total Project) CFS
"test flood" inflow discharge = 4047 CFS
"test flood" outflow discharge = 2666 CFS

Talcott Reservoir - Diversion Dike

Dam Failure Analysis

1. Failure discharge with pool at Em.Spillway (elev. 452.5) = 57000 CFS
2. Depth of water in reservoir at time of failure = 24.5 ft.
3. Maximum depth of flow downstream of dam = 24± ft.
4. Water surface elevation just downstream of dam at time of failure) = 452±

The failure discharge of 57000 CFS will enter and flow downstream 20000 feet until the brook crosses North Main Street. Valley storage in this 20000 feet length of brook is significant in reducing the discharge. Also due to roughness characteristics, obstructions and frictional losses, it is very likely that the unsteady dam failure flow will dissipate its wave and kinetic energy and thus convert to steady and uniform flow obeying Manning's formulae 20000 feet downstream. The failure profile will have the following hydraulic characteristics:

DISTANCE FROM THE DAM	WATER SURFACE ELEVATION	DEPTH (ft.)	REMARKS
0	452.5	24.5	At Dam
300	441.4	11.4	
5700	230.9	10.9	
9000	164.0	4.0	
11000	160.0	4.0	
15500	143.0	3.0	
20000	103.±	3±	North Main Street

NOTES:

Adopted Test Flood = PMF = 2510 CSM

= 4047 CFS

D. Overtopping Potential

Drainage Area 1030 acres = 1.61 sq. miles

Spillway crest elevation = N/A

Top of Dam Elevation = 458.0

Maximum spillway discharge

Capacity without overtopping of dam = N/A CFS

"test flood" inflow discharge = N/A CFS

"test flood" outflow discharge = N/A CFS
